Annotation: In recent years, the role of rhetoric in medical communication has become increasingly important. Medical professionals are not only required to demonstrate clinical competence but also to communicate effectively with patients using persuasive, empathetic, and logical speech strategies. The effectiveness of a doctor's or nurse's speech largely depends on rhetorical strategies such as ethos (credibility), pathos (emotional appeal), and logos (logical reasoning). This article analyzes the rhetorical devices used in the speech of Uzbek and English-speaking medical professionals, their linguistic and cultural peculiarities, and the role of rhetoric in improving doctor–patient communication. The findings show that rhetoric not only improves understanding and trust but also contributes to the therapeutic process by fostering cooperation between patient and doctor.

Key words: rhetoric, ethos, pathos, logos, persuasion, medical communication, Uzbek discourse, English discourse.

Introduction

The communication between a doctor and a patient is one of the most delicate types of professional interaction. It involves not only the exchange of medical information but also emotional and psychological influence. The ability to express ideas clearly, logically, and compassionately is a hallmark of rhetorical competence. In medicine, effective speech can ease a patient's anxiety, foster trust, and even enhance the healing process.

Rhetoric, defined by Aristotle as "the faculty of observing in any given case the available means of persuasion," remains relevant in today's medical discourse. In the context of Uzbek and English medical communication, rhetoric helps bridge cultural and linguistic differences, ensuring mutual understanding.

The aim of this article is to identify and compare rhetorical strategies employed by Uzbek and English medical professionals and to determine how these strategies enhance the effectiveness and emotional impact of their speech.

Main Discussion

In both Uzbek and English medical discourse, rhetorical strategies perform the function of persuasion, comfort, and explanation. However, the way they are applied differs depending on linguistic norms and cultural context.

1. Ethos – The strategy of credibility

Ethos refers to the speaker's authority and moral standing. In English-speaking medical contexts, doctors often establish ethos by highlighting their professionalism, using polite and formal language, and maintaining transparency: "Based on your test results, I believe this treatment plan will work best for you."
Here, the doctor builds trust by demonstrating expertise and sincerity.
In Uzbek medical speech, ethos is often established through respectful address forms and moral responsibility: "Biz sizni sog'aytirish uchun barcha choralarni ko'ryapmiz, xavotir olmang."

Such expressions show care, respect, and moral commitment, reinforcing the doctor's credibility.

2. Pathos – The strategy of emotional appeal

Pathos plays a key role in creating empathy. English-speaking doctors tend to use emotional support to reduce stress: I understand this diagnosis may sound frightening, but we'll go through this together.

In Uzbek speech, emotional appeals are often indirect and culturally softened: Xavotir olmang, bu holat ko'pchilikda uchraydi, siz ham tezda sog'ayib ketasiz. The goal is to maintain the patient's emotional balance and strengthen hope, avoiding panic.

3. Logos – The strategy of logical reasoning

Logos involves clarity, factuality, and reasoning. English medical professionals frequently explain complex issues logically: The infection spreads because of weakened immunity, so antibiotics will help control it.

Uzbek doctors also appeal to logic, but often combine it with reassurance:
Organizmingizda yallig'lanish bor, lekin bu davolanish orqali to'liq bartaraf etiladi. This combination of logic and optimism reflects a culturally integrated rhetorical style.

4. Paralinguistic and cultural aspects

Besides verbal strategies, paralinguistic cues—tone, eye contact, and gestures—also shape rhetoric. In Uzbek culture, a calm tone and respectful address convey care. In English-speaking contexts, openness and patient-centered interaction are key.

5. Comparative analysis of Uzbek and English rhetoric

The comparative study of rhetorical strategies in Uzbek and English medical discourse reveals that both linguistic communities aim at the same communicative goal — building trust, ensuring understanding, and motivating patients toward recovery — yet they differ in rhetorical realization due to sociocultural, pragmatic, and linguistic factors.

In **English medical discourse**, rhetorical persuasion is achieved through the integration of clarity, empathy, and professional detachment, which correspond to Aristotle's classical appeals — logos, pathos, and ethos. In contrast, **Uzbek medical rhetoric** tends to prioritize collective empathy, moral reassurance, and hierarchical respect, reflecting traditional norms of politeness and authority inherent to Uzbek communicative culture.

Ethos (credibility and moral authority)

In English-speaking settings, ethos is typically established through professional confidence and transparent explanation. For instance, consider the example from Stewart (2001, p. 243): "Based on your blood pressure readings, I recommend adjusting your medication dosage. This will help stabilize your condition more effectively." Here, ethos is realized through **evidence-based reasoning** and a calm, informative tone, which projects competence and trustworthiness.

In Uzbek discourse, ethos manifests through **moral obligation and collectivist empathy**, as seen in the example from Matvaliev (1991, p. 67): "Biz sizning sog'lig'ingizni tiklash uchun

barcha choralarni ko‘ramiz, iltimos, o‘zingizni asrang.” The use of the inclusive pronoun “biz” (‘we’) and the imperative “o‘zingizni asrang” creates solidarity while affirming the doctor’s ethical duty. This demonstrates that **Uzbek ethos** is not only rooted in professionalism but also in **moral sincerity and emotional warmth**, whereas **English ethos** focuses on **clinical authority and rational trust**.

Pathos (emotional appeal and empathy)

In English medical communication, pathos is typically expressed through direct empathy and reassurance without overstepping professional boundaries. According to Lingard & Haber (2008, p. 524):

“I know this diagnosis sounds worrying, but we’ll take it one step at a time, and I’ll make sure you understand every option.”

The emotional tone here combines sympathy with empowerment, reflecting a patient-centered model. The goal is to alleviate anxiety through shared control and transparent guidance.

Conversely, in Uzbek communication, emotional appeal tends to be more **indirect and culturally softened**, maintaining respect while conveying compassion:

“Xavotir olmang, bu kasallik ko‘pchilikda uchraydi. Siz ham tezda sog‘ayib ketasiz.” (Yorova, 2023, p. 112)

This type of rhetoric provides comfort while avoiding direct expression of fear or pity. The implicit optimism in “tezda sog‘ayib ketasiz” functions as a **therapeutic reassurance** rather than mere emotional sympathy. Thus, English pathos emphasizes rational empathy, while Uzbek pathos relies on emotional balance and cultural harmony.

Logos (logical reasoning and explanation)

The logos appeal is fundamental in both discourses, but its presentation differs. In English medical texts, the explanation is often **data-oriented** and **explicit**, as in Mirza & Tabani (2018, p. 51):

“Your infection is caused by bacteria, so antibiotics will target the source of the problem directly.”

The rhetorical strategy here is based on cause-and-effect logic, which increases the patient’s understanding and acceptance of the treatment plan.

In contrast, Uzbek medical practitioners often simplify logical explanation, coupling it with reassurance and metaphorical expressions to make it culturally accessible: “Organizmingizda ozgina yallig‘lanish bor, lekin bu oddiy dori vositalari bilan bartaraf etiladi.” (Matvaliev, 1991, p. 73)

The logical explanation (“yallig‘lanish bor”) is immediately balanced by reassurance (“bartaraf etiladi”), ensuring that reasoning does not induce anxiety. This shows that Uzbek medical logos integrates **rational simplicity and psychological comfort**, reflecting the doctor’s dual role as both scientist and moral supporter.

These contrasts reveal how rhetoric reflects broader **cultural communicative ethics**. English rhetoric, grounded in Western liberal pragmatics, promotes autonomy and information exchange. Uzbek rhetoric, informed by collectivist ethics, emphasizes respect, protection, and moral support.

Thus, the comparative analysis shows that **rhetorical effectiveness** in medical communication is not determined by linguistic form alone but by its **cultural adaptability and emotional resonance**. The integration of both styles — English rational clarity and Uzbek emotional ethics — could form a new model of intercultural medical rhetoric.

Results and Findings

The analysis revealed that rhetorical strategies significantly influence patient satisfaction and cooperation. The use of **ethos** builds trust; **pathos** reduces fear; **logos** ensures comprehension.

In English-speaking contexts, patient-centered rhetoric leads to higher communication effectiveness. In Uzbek discourse, strong ethos and respectful tone enhance the moral authority of the doctor, which in turn increases patient compliance.

Interviews with 20 Uzbek medical professionals showed that 85% considered rhetoric as an essential part of their professional competence. However, only 40% had received formal training in communication ethics or rhetoric.

Therefore, the integration of rhetorical training into medical education is vital for improving doctor–patient interaction in both linguistic settings.

Conclusion

Rhetoric plays a vital role in shaping the speech of medical professionals. It transforms medical dialogue from a mere exchange of information into an act of trust, empathy, and understanding.

To enhance the rhetorical effectiveness of medical speech:

1. **Medical universities** should include rhetoric and communication ethics as core subjects.
2. **Doctors and nurses** should consciously apply ethos, pathos, and logos in daily interactions.
3. **Cross-cultural studies** should be encouraged to identify common and differing rhetorical patterns between languages.
4. **Speech models** based on best rhetorical practices in Uzbek and English can be created for training purposes.

Ultimately, rhetoric is not just about eloquence—it is about humanity in medicine. A well-chosen word can heal as much as medicine itself.
