

## **THE IMPORTANCE OF TRANSPORT SERVICE IN THE CONTEXT OF THE GREEN ECONOMY**

***Rakhimov Azamat Hamrokulovich***

*SamIES "Management" department assistant*

**Abstract:** The article examines the importance of transport services in our country in the context of a green economy, as well as the role of transport in expanding and strengthening international relations, including trade.

**Key words:** passenger transportation, service, international relations, customer needs, technical operation, market conditions, quality of service.

**Introduction.** In the development of the 21st century, it is impossible to create the basis of a developed society without modern transport. Because transport is an important component of the productive forces of any country. In our independent Uzbekistan, transport is also of particular importance. Therefore, it has both economic and political, and, if I may say so, psychological, significance.

One of the important factors determining the good functioning of transport is the regularity of its transportation of goods and passengers. Only when the necessary products, raw materials, spare parts, fuel are transported in a timely and regular manner will their stocks in warehouses be minimal and it will be possible to organize production without interruption. Transport, especially road transport, also plays a special role in the use and transportation of natural resources. If there are no modern means of transport and developed roads, it will be difficult to effectively use natural resources. The importance of transport in transporting the population from one place to another is increasing year by year. This work is mainly carried out by passenger transport. One of the main tasks of passenger transport is to deliver people to and from work on time, to transport workers and employees between enterprises during the working day.

**Main part.** Transport also plays a significant role in expanding and strengthening international relations, including trade. The development of international trade, tourism and other relations, the growth of relations in the fields of science and technology, culture and sports largely depend on the development of transport vehicles and communication routes. In addition, one of the main tasks of transport is to provide the population with industrial and food products in a timely manner. Today, socio-economic reforms have led to dramatic structural changes in car servicing, and have set new tasks for car service, based on the economy, which is aimed at qualitatively and fully satisfying the needs of service consumers, and modern requirements for services.

Service is an activity aimed at providing services. Its distinctive feature is that, although some material resources are spent in the process of providing a service, the service is not in the form of a material, but in the way it satisfies a need through activity. The provision of a service is inseparable from the production process, it is not stored and has a non-permanent quality. The inseparability of a service from the production process lies in its consumption in this process. After the service is provided, it cannot be stored, collected or sold, therefore, when planning the volume of material, financial and labor resources required in the process of providing a service, the task of accurately predicting the demand for the service is paramount. The non-permanent nature of the quality of the service lies in the fact that the consumer cannot assess its quality before the service is provided. This is possible only after the service is provided. Therefore, information about the types and quality of services that allow the client to have a complete idea

of the service before it is provided is of great importance. Since the share of manual labor in providing a service is usually large, the quality of the service depends on the qualifications of the service provider. Technical maintenance is the rational use of resources to maintain vehicles in working order. Car service is aimed at satisfying the needs and requirements of consumers for the purchase or lease of vehicles, their maintenance in good technical condition, and the creation of comfortable operating conditions for vehicles with the necessary operational characteristics. Technical service ensures the satisfaction of the needs of vehicle owners, the smooth and safe transportation of passengers and goods, and the fulfillment of the standards set in design and production.

**Conclusion.** In general, road transport can solve many problems with the following unique advantages:

- transportation of goods from the consignor's warehouse to the consignee's warehouse, without loading and unloading the goods in between, within the specified time;
- high speed of cargo transportation and its reduction in the demand for working capital and acceleration of capital turnover;
- the possibility of transporting small batches of goods at the request of customers, etc.

Based on such possibilities, until now, automobile transport is fully operating in accordance with the laws of market relations. Business entities work in conditions of competitive competition, separated from state management, more than 70% of vehicles carrying passengers and goods on international road routes are managed by private entrepreneurs.
