

**SPECIFIC FEATURES OF THE USE OF CAVE TECHNOLOGIES IN THE PROCESS  
OF EQUIPMENT OF HOUSES IN UZBEKISTAN**

**Shohjahon Bobojonov**

Teacher at Shahrizabz State Pedagogical Institute

**Abstract:** This article highlights the high level of social and traditional education of young people in the spiritual development of the community, especially in the home. The article also reflects the specific features of the use of advanced technologies in the process of equipping home centers in Uzbekistan.

**Key words:** house-museum, history, past, development, spirituality, culture, research, generation, exhibition, exhibit.

“Thanks to the independence of the Uzbek people, the contribution of the great sons of the Uzbek people to the development of all spheres of political development over the centuries is reflected in the national expositions”<sup>1</sup>. The nuclear industry has entered a new stage of development. “The need to further refine the materials that have emerged from the research, to bring their appearance and exposition into line with international standards, to further enrich the background, to study the materials, to develop a method of preserving and preserving the materials, and to It is important to consider the ways to reach the world, to reach the world, and to reach the world”<sup>2</sup>.

“Museums are engaged in the collection, preservation, study, exhibition, and dissemination of historical collections that are considered to be sources of knowledge, knowledge, and the development of human society”<sup>3</sup>. “Therefore, museums are historical and cultural institutions, visual and social information institutions, created to identify natural and historical, natural and cultural values, and to disseminate information about the history of museums” [Davlatov B., Ibragimov O. Explanatory Dictionary of Museology Terms. –Tashkent, 2005. – P. 117. ]. Such a characteristic of the Muylars makes a great contribution to the creation of a lively winter landscape by widely promoting the transition to winter among the people. According to the famous opinion of Bernard Delosh, muzeylar ikkita vazifani bajaradi: birinchisi uslubiy theory sifatida intyitiv uzluksiz dokumentlashtiriz backli fan qizmat qiladi; It is necessary to apply reglament ethics to all the institutes that are responsible for the functional management of the second agency [Icmailova J., Nishanova K., Mykhamedova M. Myzey and society (book). - Tashkent: Chinor, 2015. - B. 7.]<sup>4</sup>. Therefore, according to the social function of the centers, the following types are distinguished: scientific research centers; research centers; educational centers; centers with a focus on specific areas of study; educational centers; and educational centers.

Today's growing human rights abuses have become a major challenge to widely promote the traditional values that underpin international policy.

“It is a global-academic study, which pays great attention to the role of interaction between the media and the media. In this regard, the world's largest online advertising campaign is a fast way to deliver the truth of the world's largest online advertising campaigns to a wide audience, a new, innovative way of advertising, and a new way of promoting the quality and speed of advertising”<sup>5</sup>.

“The Museum of Ethnography, known for its unique historical exhibits, the Institute of American Art, the Center for American Art, Britain, Russia, the United States, and other countries, will be transformed into a regional art institute, and the information of the exhibits will be The main tasks are to clarify the characteristics, to clarify the theoretical and methodological aspects of QR-computing, to move away from traditional methods and to create a clear and concise QR-computing framework for a wide audience, to study international standards for the development of QR-computing tools”<sup>6</sup>.

As a result of scientific and technological progress, computer technologies have significantly expanded the scope of scientific research, the means of information delivery, and the scope of scientific research since the 1990s. In particular, the fact that computer experts have access to a single source makes it easier to document the background of the computer. In July, the images of the nuclear exhibits are directly transferred to the computer after a photo camera, and their analysis is carried out by other scientists, and additional corrections are made by specialists as needed. This process significantly improves the quality of the catalog and card file, which is a vital part of the work.

The advent of the Internet has accelerated this process internationally. You can visit any of the centers of the Internet, read about them, as well as conferences held by the centers, the opinions of experts in the field, their online e-mails, and other information. According to the information distributed by the US-based AICO consortium, a file system containing images of more than two and a half million nuclear exhibits has been circulating on the Internet<sup>7</sup>.

Unfortunately, to this day, the work on creating websites for Uzbek universities, especially home universities, has not yet reached its final stage. The websites of some universities are still in a state of disrepair. That's right, after all, it's necessary to learn how to use a personal computer, connect it to the Internet, create a site, create a new database, etc. This is due to the fact that the delays in external activities have dampened the interest of citizens, especially foreign tourists, in the activities of the islands.

One of the most important functions of museums is their research activities. Thanks to this activity, museums not only enrich their own resources, but also make a great contribution to the discovery of historical realities through the objects in their collections. Therefore, it is necessary to further develop the field of nuclear research, expand the experience of foreign nuclear scientists in this regard, create adequate conditions for nuclear researchers, and strengthen them in terms of scientific and technical knowledge. The benefits are calculated. Another problem facing the world today is the slow pace of global propaganda. Therefore, while relying on foreign experience in this regard, Uzbekistan should improve the quality of literature on home economics, especially for students of all ages, and expand the range of television programs about home economics. It is necessary to raise the international level of the North to a new level in
