Annotation. The article highlights the opportunities created for young people by our President, ongoing reforms, and issues of innovative education and support for future generations from a new worldview perspective.

Keywords: youth, education, quality, New Uzbekistan, worldview, strategy, reform.

One of the greatest achievements of innovation in education is explained by the fact that innovations contribute to improving the quality and effectiveness of education, the ability to easily convey the content of disciplines, innovations in the process of adoption, and the ability to fully convey knowledge without errors and using new resources. Currently, "Innovation is the delivery of new complex fundamental knowledge through improved and unique, intellectually creative ways" [3, p. 33].

Innovations, an important link in large-scale reforms, today demonstrate their advantages in the higher education system, as in all spheres. In order to radically improve the higher education system, fundamentally revise the content of personnel training, and ensure the creation of necessary conditions for training specialists with higher education that meet international standards, a number of important tasks have been defined in a number of regulatory documents adopted by our government. In particular, each higher educational institution should establish close cooperation with leading scientific and educational institutions of the world, widely introduce advanced pedagogical technologies, curricula, and teaching materials based on international educational standards into the educational process, introduce foreign partner education into educational and pedagogical activities and advanced training courses.

These include actively attracting highly qualified teachers and scientists from higher education institutions, organizing systematic internships for master's students, young teachers and researchers of higher education institutions of our republic, and organizing retraining and professional development for professors and teachers. It can be said that these tasks require creativity and inquisitiveness from every teacher.

The innovative environment places very high demands on people, the most important of which are:

- be ready for the system of continuous education, constantly work on oneself, engage in independent learning, always strive for innovation;
 - to analyze, to establish the qualities of critical thinking, to demonstrate the ability to work in a team, to demonstrate the ability to be active in a competitive environment, to approach work creatively;
 - mastering foreign languages thoroughly for broad global communication, having the ability to freely converse in languages recognized by the world community as international languages.
- The innovative environment is necessarily implemented through innovative resources.

Innovative resources include:

- human capital;
- modern technologies;
- programs and manuals;
- conditions.

Innovative activity of pedagogical personnel is carried out on the basis of designing interactive methods in the educational process, modular training system, modular-credit system, ability and innovative approaches. Training of teachers for innovative activity should be carried out in two directions:

- formation of innovative readiness for the perception of novelty;
- Teaching how to act in a new way.

Innovative activity consists of motivational, technological, and reflexive parts. In the organization of innovative activity, the cognitive activity of students and its management are of particular importance. [2, p. 24]. Innovative activity is carried out in the correct choice of methods and delivery of innovative education to students based on innovative approaches. Below we will consider these indicators

Design of interactive methods

Create projects	Organization of student activities	Organization of the pedagogical innovation process	Monitoring students' innovative approach	Observation, evaluation, analysis of results do
-----------------	------------------------------------	--	--	--

Innovative education

20% organization of classroom hours (theoretical) 80% practical	Interactive learning	Interactive interaction	Creative and logical thinking	Self-assessment
--	----------------------	-------------------------	-------------------------------	-----------------

Innovative approach

Speech culture	Creative thinking	Receive and apply news making	New worldview think	Ability
----------------	-------------------	-------------------------------	---------------------	---------

In the formation of these qualities, the state should have a policy aimed at changing the environment not only in one sphere (the sphere of education is implied), but also in all spheres of public life, creating conditions in which people can fully demonstrate innovative activity and their work is stimulated. The task of forming an "innovative person" that meets the above-mentioned requirements requires fundamental modernization of important directions of state policy in the field of education in our country, especially in the field of higher education.

Today, the education system and science have become the foundation of human progress, a guarantee of the development of human capital, a force ensuring the rise of any state to a new level. The development of Uzbekistan in the coming decades depends on educating all members of society in a broad sense, creating opportunities for every person to fully realize their potential in this changing world. The basis for this can be the "Education Concept," which should be developed in the country. The goals, objectives, and principles of the education system developed in this concept must comply with the requirements of modern globalization processes and the innovative and informational development of the country.

Thus, innovative activity is manifested in education, light industry, medicine, construction, the food industry, and production. The human factor is the main link in this process. In an innovative environment, each person is required to be able to effectively perform tasks and assignments based on their abilities, interests, and potential. The innovative education system should serve the creation of an intellectual stratum in the country, the realization of the intellectual potential of each person, and be of a high quality level. Innovative education is not only can determine people's professional growth, social status, and even the meaning of their lives.

In conclusion, the innovative approaches in the education system and the comprehensive support of our youth testify to the high level of attention paid by our state to education and youth. Furthermore, rapid reforms, science, enlightenment, and innovation must be at the forefront of building a New Uzbekistan.
